

TRAC2 5.1.2

5.1.2 - The repository shall manage the number and location of copies of all digital objects.

Explanation

SP uses an automated URI generation procedure, file naming procedure, and file system to manage the number and location of objects in a consistent manner. Each object has a unique, unambiguous URI and location in archival storage. This information is located in the preservation metadata. The TSM backup system has a database that associates tape backup copies with their originals in the Pillar storage array.

Please see the [URI & File Naming Plan](#) and [Workflow Charts](#) for more information. For reference, the [Backup Plan](#) is also available.

Responsibility
