

TRAC2 4.2.4

4.2.4 - The repository shall have and use a convention that generates persistent, unique identifiers for all AIPs.

Introduction

SP uses a systematic convention to generate unique and unambiguous identifiers for AIPs within the repository. This process creates a stable name and persistent reference for every object. Please see the [URI & File Naming Plan](#) for details. An identifier may change if the Provider replaces an article with a new version of the same article. Please see [4.2.4.1](#) for more information.
