TRAC2 4.1.2

4.1.2 - The repository shall clearly specify the information that needs to be associated with specific Content Information at the time of its deposit.

Introduction

Although SP is not dependent on, or restricted to, any particular file formats upon Provider deposit, it nevertheless aims to use well known, widely accepted formats that support long-term preservation. The repository requires Provider-supplied XML or SGML, ideally in the NLM Journal Archiving and Interchange Tag Set, which contains descriptive (e.g. bibliographic) as well as structural (e.g. file relationships) metadata. If a Provider wants to use a specific format not meeting these criteria, an agreement must be reached between the Provider and SP. These conditions are specified in SP's Provider Agreement or License. Please see the additional documents below for more detail.

Responsibility

Digital Preservation Policy Librarian

OCUL Projects Officer
